Assignment Outcomes and Milestones

程序代写代做 CS编程辅导

- learn how to construct portfolios and strategies, and calculate their expected returns
- improve your programming skills (running regressions, producing plots, computing descriptive statistics, cleaning data)
- exercise fin. econometrics that you are learning

WeChat: cstutorcs

Timeline:

Assignment Project Exam Help

- Feb 6, 2023 - Point 1: Portfolio construction (30 %) [Email: tutorcs@163.com](mailto:tutorcs@163.com)
- Feedback
- Mar 6, 2023 - Point 1 (potentially updated) +
Point 2: Trading strategies analysis (45%) <https://tutorcs.com>
and Point 3. Factor regressions (25%)

Note that the 5-page limit is for all 3 points.

程序代写代做 CS编程辅导

1/N Strategy

Simple trading rule:

'fraction $1/N$ of wealth is allocated to each of the N assets available for investment at each rebalancing date'.

Assignment Project Exam Help

- Horseshoe of 14 mean-variance optimal portfolios against 1/N benchmark.
- For considered assets, during the considered time period none of the 14 outperforms consistently the simple 1/N rule.
- Based on simulation analysis, one needs 3000 months of formation period for mean-variance portfolio to outperform the 1/N rule (yep, that's 250 years).

<https://tutorcs.com>

Your coursework vs Paper

程序代写代做 CS编程辅导

	CW	Paper
Strategies	only	1/N + 14 more strategies
Formation period	6M, 12M, 48M	60M, 120M
Trading period	1M, 3M, 6M	1M
Rebalancing	Monthly	Monthly
Assets	Stocks (thousands)	Stock indices & portfolios (dozens)

QQ: 749389476

You will also see in the paper bunch of robustness checks and simulation analysis. For the purposes of the coursework, you can safely ignore those parts as well as the 14 mean-variance strategies.

<https://tutors.com>

So, what exactly you need to do (or Methodology)

程序代写代做 CS编程辅导

First, load the data:

① Daily stocks data for 1990 - December 31, 2014

- Column 1: **stock** - 16147 'tickers'
- Column 2: **dates** - 6301 dates
- Column 3: **SICs** - 1354 industry codes (you won't need these)
- Column 4: **prices** - well, prices
- Column 5: **market capitalisations**

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutorcs@163.com

② Some more data (you will need these for Points 2-3 only)

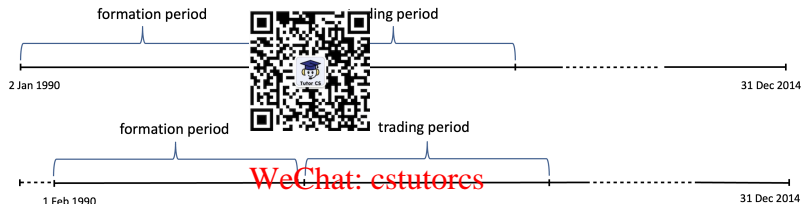

- **F-F5 factors** - simple returns expressed as % (so divide them by 100)

QQ: 749389476

<https://tutorcs.com>

Now, we can construct the portfolios

程序代写代做 CS编程辅导

WeChat: [estutorcs](#)

Assignment Project Exam Help

and so on. . .

Email: tutorcs@163.com

You will consider:

- ① formation periods of $J = 6, 12, 48$ months, and
- ② trading periods of $K = 1, 3, 6$ months,
- ③ thus, 9 'J-K' strategies in total.

QQ: 749389476

<https://tutorcs.com>

Methodology cnt'd: Portfolios Construction

程序代写代做 CS编程辅导

In the beginning of each t , repeat the following steps:

1. define the stock universe (filter out stocks with missing data over the past J months);
2. long each stock in the universe; hold these positions for K months.

WeChat: cstutorcs
Assignment Project Exam Help
Email: tutorcs@163.com

At this point you already have everything for **Point 1** of the assignment: report the average number of stocks and average market capitalisation for each of the 9 strategies.

QQ: 749389476
https://tutorcs.com

Methodology cnt'd: Strategy Return Computation

Method 1 (without volatility targeting): 程序代写代做 CS编程辅导

$$\frac{1}{N_t} \sum_{i=1}^{N_t} r_{i,t}$$

- simple average of all N_t stocks' returns in month t ;
- N_t is the number of stocks in the stock universe in month t .

Method 2 (with volatility targeting, VT): Assignment Project Exam Help

Email: tutorcs@163.com

$$r_t^{VT} = r_t \frac{\sigma_{target}}{\hat{\sigma}_t}$$

QQ: 749389476

<https://tutorcs.com>

- σ_{target} is annualised volatility of market returns over Jan 1990-Dec 2014 from FF-5 datafile (up to you whether to use daily or monthly data for this calculation);
- $\hat{\sigma}_t$ is volatility of daily strategy returns in previous J months (analogically to formula (5) in Barosso et al).

程序代写代做 CS编程辅导

Point 2:

- calculate and analyse the requested statistics of 9 strategies with and without volatility targeting (hence 18 return series in total now).

Website: tutorcs.com

Point 3:

Assignment Project Exam Help

- analyse the exposure of all strategies returns to the F-F5 factors as well as the alpha (18 regressions in total).

程序代写代做 CS编程辅导

1. **Do I have to use**  please use any software of your choice. To convert data file into  run the following lines of code:

```
library(data.table)
load("assignment_data18.RData")
fwrite(data, "assignment_data18.csv")
```

Writing to csv takes 10-20 seconds (Don't use R's native 'write.csv' function - it takes hours)

2. **Do I need to submit the code?** - No, don't submit your code. Instead, include a methodology section which outlines all of your steps (portfolio construction, missing value treatment, etc.). This will enable me to verify your results.

WeChat: cstutorcs

Email: tutorcs@163.com

QQ: 749389476

<https://tutorcs.com>

程序代写代做 CS编程辅导

3. **What exactly should I submit in Point 1?** - You should include (1) an output table and (2) a methodology section which outlines all of your steps and assumptions (portfolios, construction, missing value treatment, etc.) detailed enough for the grader to replicate your results. This will enable me to verify your results.

4. **Could you give us an example of the output table in Point 1?** - This should be a table (2x9) reporting number of stocks and average market equity for each portfolio. Here is what that table could look like.

Email: tutorcs@163.com

Strategy	6-1	6-3	6-6	12-1	12-3	12-6	48-1	48-3	48-6
NOSH	30	85	167
ME, mln	598	605	602

QQ: 749389476

<https://tutorcs.com>

Numbers are made up. Your table should be fully populated and have no '...' in it.

程序代写代做 CS编程辅导

5. What function will I suggest for ...?

- ① ... selecting first/last value (say, last market cap or price within a month)? - `first()/last()`
 - to be used inside `group_by()`
- ② ... counting the stocks? - `length()` of unique permios or `n()` or `sum()` of indicator function
- ③ ... computing smth over multiple periods? - `lead()/lag()`t
 - first make sure the data are sorted in correct order, e.g. using `arrange()`

QQ: 749389476

程序代写代做 CS编程辅导

6. Treatment of zero and NaN prices

One does NOT just remove individual rows that have zero or NaN prices. This will distort your portfolio allocations - even if you remove the rows with zero or NaN price, you are keeping the rest of the prices for that month for that stock; as a result you might include the stock that was delisted into your stock universe and later into your portfolio.

WeChat: cstutorcs

7. Overlapping trading periods

Assignment Project Exam Help

- for trading periods of 3 and 6 months, each month you will have up to $K = 3, 6$ overlapping portfolios initiated 1 month apart;
- in each month average out the returns on portfolios initiated this month and in previous $K-1$ months;
- for trading period of 1 month there is no overlapping.

Email: tutores@163.com

QQ: 749389476

<https://tutorcs.com>

8. Stock return calculation

Use `group_by(permono)` when calculating the stock returns to ensure that you do not use the last price of the previous stock by mistake.

程序代写代做 CS编程辅导

Good Luck!
